

		Immediate outcome	Near term outcome	GOAL
QUALITY BY DESIGN	<ol style="list-style-type: none"> <li>To what extent does sensor design affect quality?</li> <li>Should SC37 consider adding Best Capture Practice to existing data format standards?</li> <li>How to provide effective feedback to users at the time of capture?</li> <li>Given that data format standards are under revision, should it be considered to revise or add quality-related clauses (e.g. compression limits) to data format standards so that conformance to those standards ensures quality?</li> </ol>	Comprehensive lists of sensor properties, acquisition settings, and user behavior factors that affect quality.	<p>Perform studies to measure how each factor affects quality.</p> <p>Make quality “actionable” by providing feedback to user.</p> <p>Possibly introduce tolerance in data format standards similar to ISO/IEC 19794-5.</p>	DRIVE FINGER, FACE AND IRIS ACQUISITION ERRORS TO ZERO.
QUALITY CALIBRATION	<p>Quality Calibration (QC) aims at quality score interpretation and interoperability by relating quality scores to performance. QC maps the output of a quality assessment algorithm to performance of a given matcher. Therefore, QC provides:</p> <ul style="list-style-type: none"> <li>interpretation (or context) to quality scores computed by a quality assessment algorithm, and</li> <li>interoperability of quality scores computed by two or more quality assessment algorithms.</li> </ul> <p>Quality calibration can be performed for a specific matching algorithm so that quality scores are indicative of performance of that particular matcher, or calibration can be done for general use.</p> <ol style="list-style-type: none"> <li>Could QC improve interoperability?</li> <li>If so, should NIST leverage its data resources to establish a QC program?</li> </ol>	Best practices for quality calibration	NIST offers open source quality calibration utility; vendors shall calibrate their quality algorithm accordingly.	INTERPRETATION AND INTEROPERABILITY OF QUALITY SCORES.
QUALITY REFERENCE DATA	<ol style="list-style-type: none"> <li>Would sequestered or public quality annotated corpora be useful in quality interoperability or quality evaluation?</li> <li>If these are useful and needed, how to build a quality reference data set?</li> <li>Would a standard reference algorithm for each modality be useful?</li> </ol>	Shall keep QSND in ISO/IEC 29794 or not?	If QSND is useful, how to build and maintain it?	PUBLICATION OF QUALITY ANNOTATED DATASETS FOR FINGER, FACE, AND IRIS.
QUALITY EVALUATION	<ol style="list-style-type: none"> <li>What are the relevant performance metrics?</li> <li>How should speed of operation be considered?</li> <li>Is standardized performance testing of quality measurement algorithms needed?</li> <li>Is certification of quality measurement algorithms needed?</li> </ol>	<p>A test plan for quality assessment algorithms with execution time <math>\leq 20</math> ms e.g. for verification applications.</p> <p>A test plan for quality assessment algorithms with execution time <math>\leq 200</math> ms e.g. for enrollment applications.</p>	Quality evaluation of quality assessment algorithms	IMPROVE THE STATE-OF-THE-ART BY CONDUCTING BIOMETRIC QUALITY GRAND CHALLENGE (BQGC)
